Examiner's Comment

Examiner acknowledges that the applicant has amended claims 10 and 13. Currently, claims 10-14 are pending in the application. Applicant's arguments, see pages 4-7, filed January 17, 2008, with respect to claims 10-14 have been fully considered and are persuasive. The claim rejections - 35 USC § 103 of September 17, 2007 has been withdrawn.

Examiner's Statement of Reasons for Allowance

The following is an examiner's statement of reasons for allowance: the claim recites an optical signaling device for a vehicle, comprising: at least one support element, a revolving element, drive means, and one or more optical signaling elements associated with the revolving element and electrically connected to an electric power source for illumination, wherein the laser rays emitted by the generators/emitters are inclined downwardly towards a roadway beneath the vehicle, thus the vehicle being clearly visible during conditions of poor visibility.

Because none of the references disclosed the details of the optical signaling elements being laser generators/emitters, which provides cone-shaped pattern of light enveloping the vehicle to enhance the visibility, nor is there any motivation to combine the details, the claims are deemed patentable over the prior art of record.

Pederson (USPN 6,547,410) teaches at least one support element (780) fitted onto a vehicle (Figures 61-62), at least one revolving element (804, 806, 810) arranged on the support element (Figures 65-66) for rotation about a *substantially* vertical axis

Art Unit: 2885

(818, 822, 816, 815, 820), drive means (794) acting on the revolving element to promote rotation thereof about the rotation axis (column 46, lines 45-55; "... *the housing enclosure 780 is preferably located a motor 794 having a worm gear 796 engaged to a shaft 798. Engagement of motor 794 rotates shaft 798 in turn rotating worm gear 796. The motor 794 is preferably electrically coupled to the electrical system and/or controller 50 for the emergency vehicle*") , one or more optical signaling elements (786) associated with the revolving element (804, 806, 810) and electrically connected to an electric power source for illuminating them (columns 46-47, lines 55-10; "... *If rotation of the first alley light 800 is desired, then gear 804 may include a receiving slot 792 to provide electrical connection and power to the LED light source 784 for provision of light*") , each of the optical signaling elements comprising light generators/emitters (786), wherein the revolving element (804, 806, 810) comprises a cylindrical body (Figures 4-5, 12) coaxial with the rotation axis and housing (Figure 64, 780) internally thereof the one or more light generators/emitters (786), the light generators/emitters being arranged in a respective seat (columns 46-47, lines 55-10; "...*one or more LED's 786 which are preferably each positioned within a culminator reflector 802 for reflection*") with emission hole (802; Figures 31-32) coaxial therewith, formed on the side surface of the cylindrical body (Figures 4, 5, 12, 51, 66), each of the seats (802) and the respective emission holes having a respective longitudinal axis inclined with respect to the rotation axis of the cylindrical body (columns 46-47, lines 55-10; "... *first alley light 800 is preferably formed of one or more LED's 786 which are preferably each positioned within a culminator reflector 802 for reflection and maximization of light transmission along a*

Art Unit: 2885

desired path of illumination”), the drive means (794) being so coupled to the revolving element (804, 806, 810) to promote the rotation of the body about the rotation axis at the sufficient rotational speed to form a pattern of light (column 35-65; “... *provide any desired color, pattern, combination of patterns, and/or types of light signals including, but not necessarily limited to, flashing, stroboscopic, modulated, variable, pulsating, oscillating, alternating, rotating, illumination of arrows, and/or other types of variable light signals or combination of light signals as earlier described*”), the pattern of light having its base directed towards (Figure 66; 784) the plane of travel of the vehicle (columns 46-47, lines 55-10; “... *a culminator reflector 802 for reflection and maximization of light transmission along a desired path of illumination*”) and its vertex arranged on the rotation axis (Figures 61-62). However, failed to include details of the optical signaling elements being laser generator/emitters and the cone-shaped pattern of light enveloping the vehicle on which it is mounted.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Bleiner (US 2004/0041983) – visual signaling device adaptable to a vehicle

Newcomer (USPN 6,772,525) – laser device for guiding a vehicle
